Administrator's Guide

Microsoft Windows CE Image for HP
Compaq Thin Clients

Version: Windows CE 5.0
Model: t5520

July 2006

This guide provides network administrators with basic instructions
for configuring CE-based thin clients.

WARNING: Text set off in this manner indicates that failure to follow directions could result in bodily harm or loss of life.

CAUTION: Text set off in this manner indicates that failure to follow directions could result in damage to equipment or loss of information.

Introduction

HP Compaq thin clients with Microsoft Windows CE are easy to deploy, manage, and secure, and include powerful features for mainstream business use.

- Easy to deploy
  - ❏ Setup Wizard for easy configuration
  - ❏ Familiar explorer shell that resembles Windows desktop
  - ❏ Altiris Deployment Server
- Easy to manage
  - ❏ Registry import tool
  - ❏ Can update to the latest image directly from HP
  - ❏ Can return to factory settings by pressing **F9**
- Easy to secure
  - ❏ Can disable USB mass storage
  - ❏ Can lockdown user interface with Connection Administrator
  - ❏ Secure default Guest account
  - ❏ More secure operating system

HP provides this client "ready to go" out of the box to meet most common customer requirements. You may want to add/remove features, lock down the user interface, etc. This guide will introduce you to the many features of this client and show you how to customize the client to your needs.

This guide provides the network administrator with instructions for local and remote configuration of the CE-based terminal. Typically, a terminal is configured locally then used as a template for other terminals, which are then configured using remote administration tools.

Image Updates

HP provides periodic updates to the image for thin clients. Check the HP support site for important documentation that provides specific information for your image version. You can find support documentation at:

http://welcome.hp.com/country/us/en/support.html.

For the latest version of the HP thin client Microsoft Windows CE image, visit:

http://h18004.www1.hp.com/support/files/thinclients/us/index.html

Setup Wizard

HP's Microsoft Windows CE images include a Setup Wizard, which provides a simplified, easy-to-follow method to configure a thin client. The Setup Wizard launches after you unbundle the image.

✎ There is a 20-second delay after the Setup Wizard launches. If you do not click **Next** before the timer expires, the thin clients loads the default settings.

Updates for image refresh version 5.0

■ ICA seamless windows.

■ RDP 5.5 Add-on.

■ VNC Server Add-on.

■ Auto DHCP Update Feature enabled by default.

■ TxtPad Add-on.

■ Support for the EHCI USB controller driver (i.e. USB 2.0) on select models.

■ Dynamic DNS. Secure updates are supported with Kerberos encryption, which is only supported with Windows 2000 and 2003 Servers.

■ DMA flash enabled.

■ Messenger 5.0 Add-on.

PC Session Allocation Manager (PC SAM)

HP's PC Session Allocation Manager (PC SAM) software provides dynamic allocation for assignment of virtual desktop sessions. In a Consolidated Client Infrastructure (CCI) desktop virtualization environment, PC SAM enables a higher level of virtualization in your company by managing all the remote desktop connections from users' access devices to their computing resources thus helping you get the most out of IT deployments.

For more information about PC SAM, go to
http://welcome.hp.com/country/us/en/solutions/leb.html

and perform a search on **PC SAM**.

2
The Desktop

The t5000 series thin client with Microsoft Windows CE uses an explorer shell (desktop) that resembles the typical Windows desktop to make it look familiar and easy to use. The desktop includes a taskbar, Start menu, shortcut icons, and a background image.

✎ The taskbar and the Start menu are hidden by default.

Display

To change the display settings, right-click on the desktop and select **Properties**. You can change the following:

■ background image

■ appearance

■ resolution and color quality settings

■ screen saver

✎ You must reboot for changes to the display settings to take effect. If you do not know if your monitor supports a setting, click the **Test** button on the Display Properties Settings tab.

For more information about display settings, see Chapter 4, in section "Display."

Taskbar

Move the pointer to the bottom of the screen to display the taskbar. The taskbar is hidden by default to provide a clean ICA connection experience.

The taskbar provides access to system software. The taskbar includes:

■ **Start** button

■ active task buttons - currently running programs

■ notification area - the system tray
To configure the thin client to show the taskbar:

1. Right-click on the taskbar.

2. Select **Properties**.

3. Clear the **Auto hide** check box.

Start menu

To open the Start menu, click the **Start** button on the taskbar. The Start menu provides access to software and settings, allows you to run commands, and allows you to shut down the system.

Icons

The icons on the desktop provide shortcuts to software and connections. To launch a program from the desktop, double-click the respective icon.

You can add icons for connections by right-clicking on the connection icon in the HP Connection for Citrix software and selecting **Send to Desktop**. For more information, see Chapter 5, in section "HP Connections for Citrix Software.".

✎ Windows CE architecture does not allow you to change the properties of programs from desktop shortcuts. You can only change property values for the shortcut itself from the desktop.

3

HP Connection Administrator

The HP Connection Administrator allows you to:

- Manage user accounts.

- Add, edit, and delete connections.

  - ❏ Citrix ICA connections

  - ❏ Microsoft RDP connections

  - ❏ Terminal emulation

  - ❏ PC SAM

  - ❏ Internet Explorer

- Assign connections to users.

The main HP Connection Administrator window allows you to perform actions for only the current user. To assign connections to other users, use the HP Connection Administrator Advanced window. For more information about the Advanced window, see "Advanced window" on page 3.

You can access HP Connection Administrator through the Start menu by clicking **Start > Programs > HP Connection Administrator**.
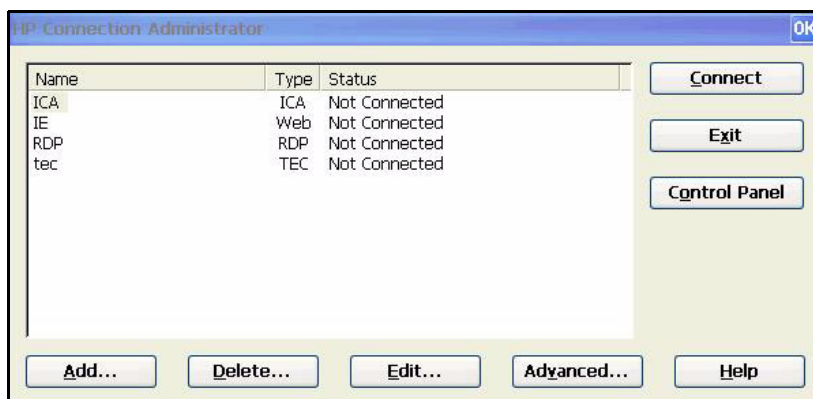

The HP Connection Administrator window includes the following features:

✎ You must close all active connections to use the following buttons: **Add**, **Delete**, **Edit**, **Advanced**, **Exit**.

■ **Connection display area:** Lists all connections assigned to the user currently logged on to the terminal. For each connection, the display shows the name, type, and status of the connection.

■ **Connect:** Click to activate a selected connection.

■ **Exit:** Click to exit HP Connection Administrator. The **OK** button performs the same function.

■ **Control Panel:** Click to access the Control Panel. This feature requires appropriate permissions.

■ **Add:** Click to create a new connection and add it to the list of connections assigned to the user currently logged on to the terminal. You can assign the new connection to other users in the Advanced window. For more information, see "Adding connections" on page 9.

■ **Delete:** Click to delete a selected connection. The connection is deleted from the list of connections available to all users, not just the user currently logged on to the terminal. For more information, see "Deleting connections" on page 10.

- **Edit:** Click to edit the selected connection. For more information, see "Editing connections" on page 10.

- **Advanced:** Click to access the Advanced window, where you can configure and assign connections and configure the terminal user interface. For more information, see "Advanced window" on page 3.

- **Help:** Click to access help.

Advanced window

You can access the Advanced window by clicking the **Advanced** button in HP Connection Administrator. You must log in with Administrator permissions or with the "User may add, edit, or delete connections" permission to access the Advanced window. The Advanced window allows you to configure and assign connections, set up user security accounts, and configure the user interface for the terminal.

⚠ Click either **OK** button to save changes and close the Advanced window. Click the **X** button or **Cancel** to exit without saving changes.
Creating user accounts

You can set up terminal operator user accounts in the Security window, which you can access either from the Connection Administrator Advanced window or from Control Panel.

The system comes with three default accounts:

■ Administrator

■ Guest

■ User

You can use the default accounts as templates for new accounts. You can modify the default Guest and User accounts.

The Users tab lists all operator accounts and shows which accounts are set up with Administrator security permissions and which accounts are enabled.
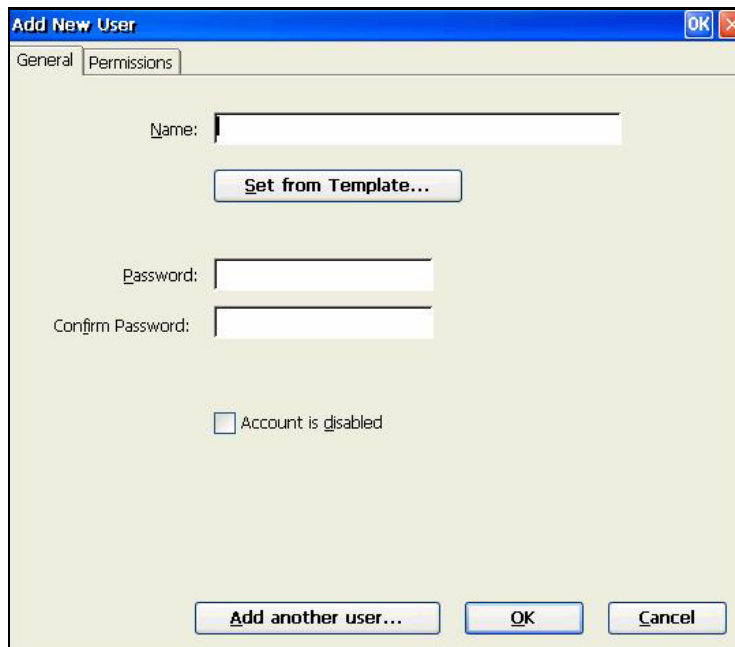

To create a new user account:

1. In the HP Connection Administrator, click **Advanced**.

2. On the Assign Connections tab of the Advanced window, click **Security**. This takes you to the Control Panel Security window.

3. Select the Users tab, and then click **Add** to create a new user account.
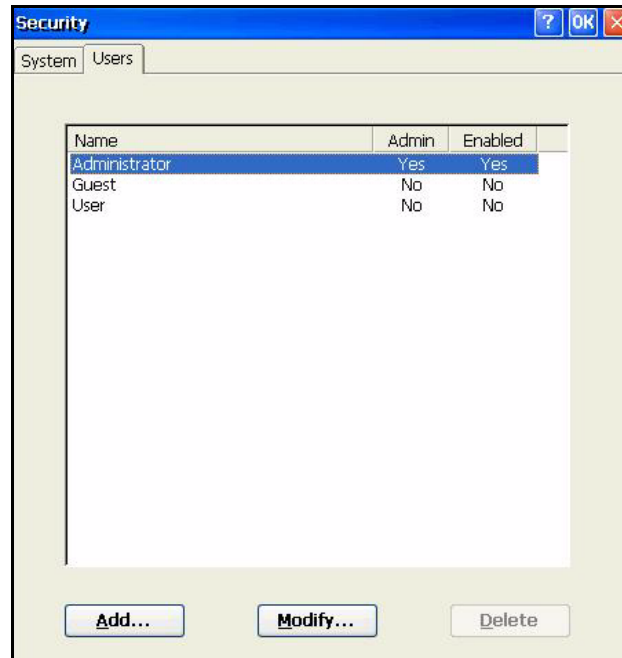

4. On the General tab, type a name for the new user account in the **Name** field. Valid characters for the **Name** field include: A - Z, a - z, 0 - 9. (.)&^%$#!~''{ }_-. Maximum length is 20 characters.

5. Type a password for the new user in the **Password** field.

6. Retype the password in the **Confirm Password** field.

7. To enable the user account, clear the **Account is disabled** check box.

8. To assign the same permissions to the new account that are assigned to an existing account, click **Set from Template**.

a. In the **Based on** box, select the account to use as a template.

b. Click **OK** to save your settings and return to the Add New User window.

c. To add another user, click **Add another user**. This option allows you to quickly add new users.

9. To select permissions for the new account, select the Permissions tab on the Add New User window.
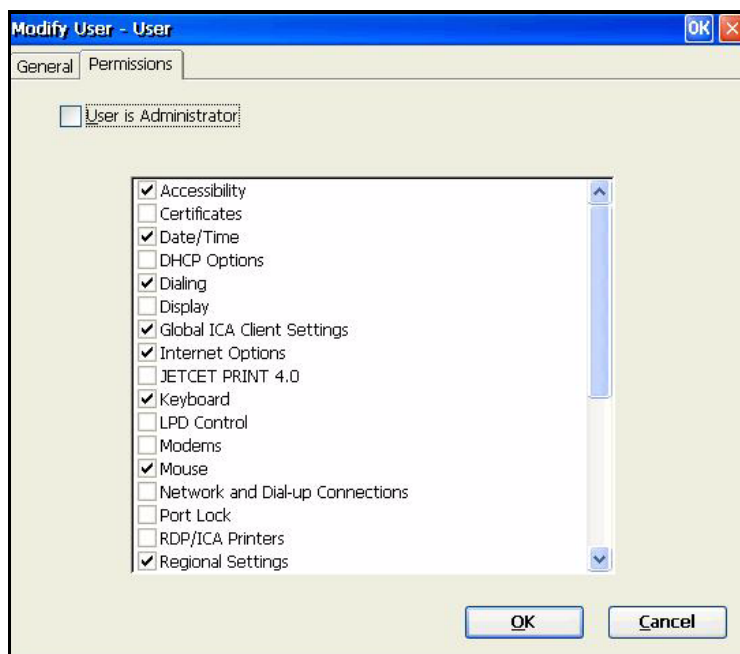

a. Select the items in the permissions list that you want to allow the user to access. If the user is an Administrator, select **User is Administrator** to provide full access. If you select **User is Administrator**, you cannot select or clear items in the list.

b. To save your settings and add another user, click **Add another user**.

   or

   Click **OK** to save your settings.

10. Click **OK** when you are finished adding users.

11. If you want to modify or delete user accounts, select the account, and then click **Modify** or **Delete**.

12. Click **OK** at the top of the window when you are done adding or modify user accounts.

Connections

You can add, edit, or delete connections in the HP Connection Administrator and in the Advanced window. Add connections as follows:

■ Use the HP Connection Administrator to create and assign connections to the user currently logged on to the terminal.

■ Use the Advanced window to assign the connection to other users.

Adding connections

To add a connection in HP Connection Administrator:

1. In the HP Connection Administrator, click **Add**.

2. In the Choose type dialog box, select the type of connection you want to create and click **OK**. A Wizard or setup dialog for the connection type displays.

3. Follow the on-screen instructions in the Wizard or setup dialog to add the connection to the user's connections list and to the list of available connections that you can assign to other users in the Advanced window.
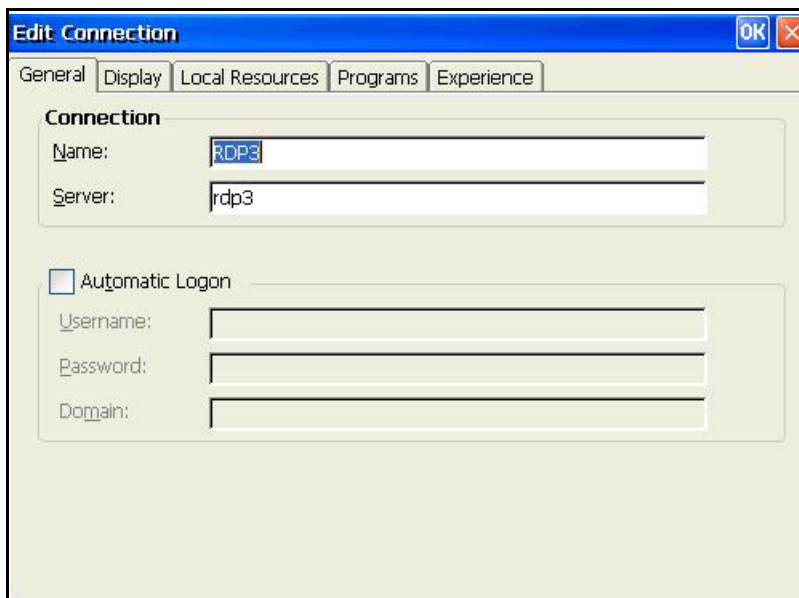

✎ If you create a connection in HP Connections for Citrix Software, the connection also displays in HP Connection Administrator. Similarly, connections created in HP Connection Administrator also display in HP Connections for Citrix Software.

Editing connections

To edit a connection in HP Connection Administrator:

» Select the connection, and then click **Edit**. Make the appropriate changes in the Wizard or setup dialog.

✎ Renaming a connection effectively deletes it from all user accounts.

Deleting connections

To delete a connection in HP Connection Administrator:

» Select the connection, and then click **Delete**. The connection is deleted from *all* user connection lists.

Assigning connections to users

Assign and configure connections for users in the Advanced window of Connection Administrator.

Assign Connections tab

The Assign Connections tab allows you to assign connections to users. This tab contains the following features:
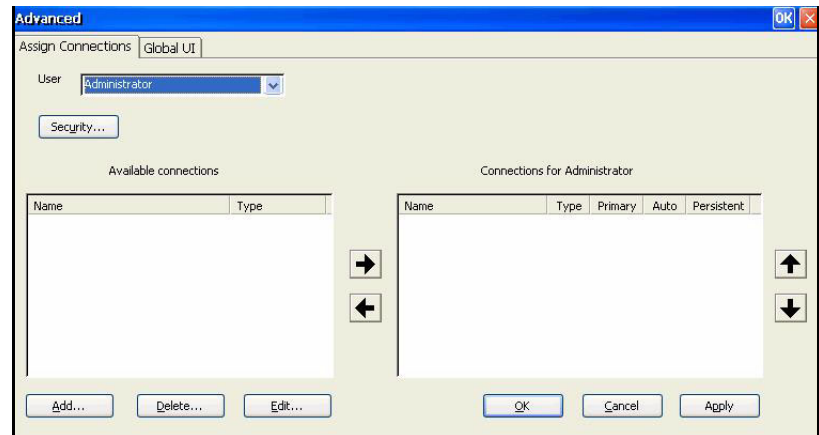

■ **User:** This list includes all users accounts associated with the system. To configure connections for a user, select the user from the list.

■ **Security:** Allows you to access the Security window, where you can create and configure user accounts. This button opens the same window as selecting **Security** from Control Panel.

■ **Available connections:** On the left side of the window, this panel displays all available connections that you can assign to users. The columns in this panel include:

❏ **Name:** Displays the name of the connection assigned when the connection was created.

❏ **Type:** Displays the type of connection.

■ **Add:** Click to create a new connection and add it to the **Available connections** list. Clicking this button displays a connection type list. When you select a connection type to add and click OK, a wizard opens that allows you to configure connections.

■ **Delete:** Select a connection in the **Available connections** list, and then click this button to delete the connection. Deleting a connection here also deletes the connection from the list of connections assigned to all users.

■ **Edit:** Select a connection in the **Available connections** list, and then click this button to edit the connection.

■ **Connections for [*user*]:** On the right side of the window, this panel displays the connections assigned to the user displayed in the **User** box.

❏ **Name:** Displays the name of the connection assigned to the user.

❏ **Type:** Displays the type of connection.

❏ **Primary:** Designates a connection as either primary or secondary. **Yes** indicates a primary connection. Click on the column value to change the setting. You cannot change the first connection in the list to secondary.

❏ **Auto:** Determines whether the system automatically connects when HP Connection Administrator starts up. **Yes** indicates the system will automatically connect. Click on the column value to change the setting. NOTE: You must configure HP Connection Administrator to auto start for this setting to function properly. To configure Connection Administrator to automatically start up, see "Auto starting Connection Administrator".

❏ **Persistent:** Determines whether the system will attempt to reconnect when a connection fails. **Yes** indicates the system will automatically attempt to reconnect. Click on the column value to change the setting.

■ **OK:** Click to save changes and exit the Advanced window.

■ **Cancel:** Click to cancel unsaved changes and exit the Advanced window.

■ **Apply:** Click to save changes.

Assigning connections

Once you have created a connection, you can assign it to users in the Advanced window.

1. In the HP Connection Administrator, click **Advanced**.

2. On the Assign Connections tab, select the appropriate user from the **User** list.
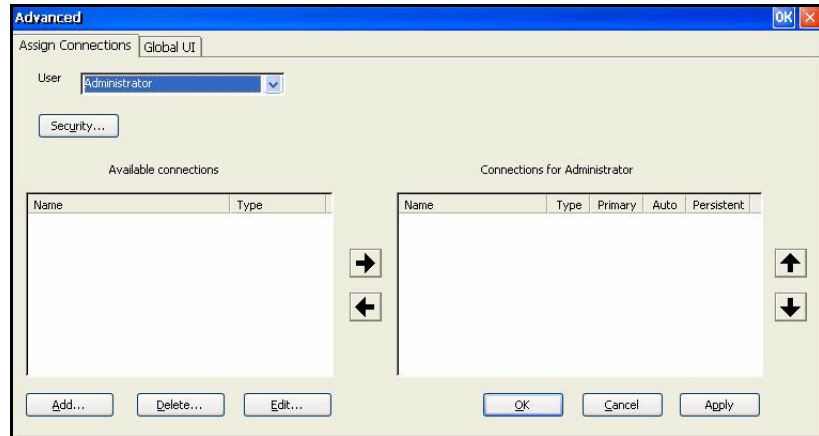

3. Double-click the connection in the **Available connections** list, or select the connection and click the right arrow. The connection is copied to the **Connections for [user]** list.

4. Click **Apply** to save the updated list of connections for the user.

Designating connections as primary or secondary

You can designate connections as primary or secondary in the Advanced window. A primary connection is the first attempted in a group of connections. If a primary connection fails, the system attempts failover secondary connections in the order they are listed. You can configure more than one primary connection, each of which can have several secondary connections associated with it. Secondary connections are optional.

To designate a connection as primary or secondary:

1. In the HP Connection Administrator window, click **Advanced**.

2. On the Assign Connections tab, select the appropriate user from the **User** list.

3. Select the connection from the user's connection list that you want to make primary.

4. In the **Primary** column, click on the column value to change it. **Yes** means the connection is a primary connection. The first entry in the list must be primary.

5. If you want to assign a secondary connection, select the connection and change the value in the **Primary** column to **No**. The connection becomes secondary to the first primary connection directly above it in the list.

6. To arrange the order of connections, select a connection and click the up and down arrows. Secondary connections are associated with the first primary connection above them in the list.

7. Click **Apply**.

✎ Every secondary connection must have a primary connection listed above it.

Enabling automatic connection and reconnection

In the Advanced window, you can set up primary connections assigned to users to automatically connect at boot up and to reconnect if disconnected. Automatic connection requires that you configure the Connection Adminstrator to start automatically. For more information, see "Auto starting Connection Administrator".

To enable automatic connection and reconnection:

1. In the HP Connection Administrator window, click **Advanced**.

2. On the Assign Connections tab, select the appropriate user from the **User** list.

3. Select the primary connection in the user's connection list that you want to automatically connect.
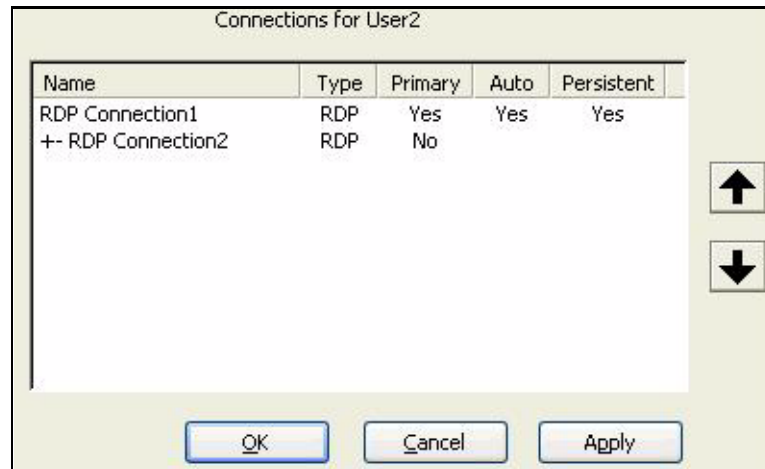

4. In the **Auto** column, if the entry for the selected connection is **No**, click on **No** to change it to **Yes**.

5. Select the connection in the user's connection list that you want to make automatically reconnect.

✎ You can set only primary connections to automatically reconnect.

6. In the **Persistent** column, if the entry for the selected connection is **No**, click on **No** to change it to **Yes**.

7. To arrange the order of connections, select a connection and click the up and down arrows. Secondary connections are associated with the first primary connection above them in the list.

8. Click **Apply** to save your changes.

✎ You can set only primary connections to automatically connect when HP Connection Administrator is launched.

Configuring the user interface

The Global UI tab on the Advanced window allows you to configure the Connection Adminstrator to start automatically and allows you to set up Kiosk mode.

Auto starting Connection Administrator

You can enable automatic log on, which causes Connection Administrator to start automatically when the user logs in to Windows.

To auto start Connection Administrator:

1. In the HP Connection Administrator window, click **Advanced**.

2. Click the Global UI tab.
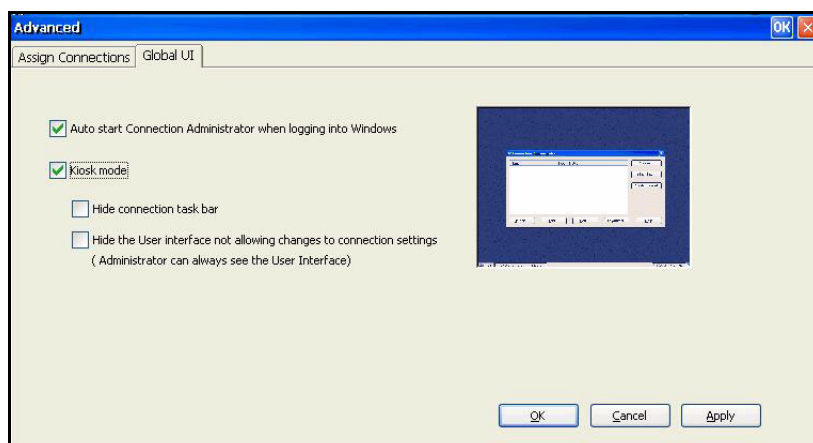

3. Select **Auto start Connection Administrator when logging into Windows.**

4. Click **Apply** to save changes.

Setting the terminal to Kiosk mode

Kiosk mode limits the terminal's functionality by hiding the desktop icons and limiting the Start menu to Shut Down only. There are also Kiosk mode options for hiding the task bar and hiding HP Connection Administrator.

✎ Before setting a terminal to run in Kiosk mode, you must define a user and create a connection. For more information, refer to "Creating user accounts" and "Connections".

The preview display on the right side of the screen shows you how the user interface will appear when you select the various check boxes on the left side of the tab.

To set the terminal to run in Kiosk mode:

1. Create the necessary connection.

2. On the HP Connection Administrator window, click **Advanced**.

3. Click the Global UI tab.
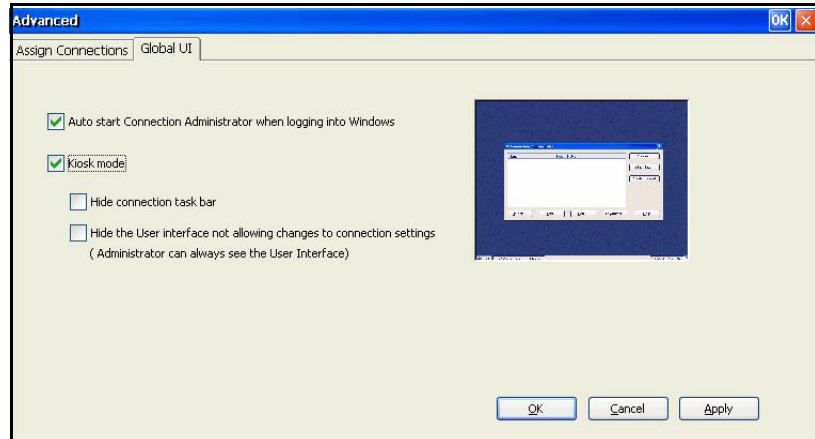

4. Select **Auto start Connection Administrator check box when logging into Windows** check box. This makes the **Kiosk mode** option available.

5. Select **Kiosk mode**. Two more check boxes become available as options.

6. To further lock down the terminal in Kiosk mode by hiding the task bar at the bottom of the desktop, select the **Hide connection task bar** check box. You must select the automatic logon feature to gain access to this feature.

7. To further lock down the terminal in Kiosk mode by hiding the user interface to connection settings, select **Hide the User interface not allowing changes to connection settings**. You must select the automatic logon feature to gain access to this feature.
8. Click **Apply** to save your changes, or click **OK** to save your changes and exit the Advanced window.

9. Log off the user for all changes to take effect.

Enabling automatic log on and keyboard functions

The Security window in Control Panel allows you to enable automatic log on which bypasses a user's password requirement when logging on to the system.

To enable automatic log on:

1. On the HP Connection Administrator window, click **Advanced**.

2. Click **Security**. The System Statistics area displays information about system users and connections.
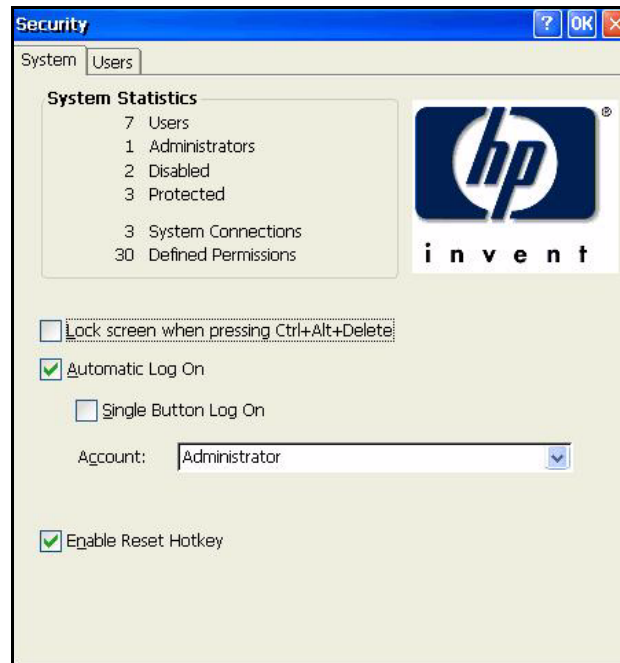

3. On the System tab, select **Automatic Log On** so the user does not have to enter a password to log in to the local machine. You can set up automatic log on for one user per terminal. The default is no password. You must select **Automatic Log On** to gain access to the **Single Button Log On** check box and the **Account** list.

4. If you want to lock the terminal when pressing **Ctrl+Alt+Delete**, select **Lock screen when pressing Ctrl+Alt+Delete.** This feature allows users to quickly lock their terminal and prevent unauthorized access. When the terminal is locked, press **Ctrl+Alt+Delete** again to type your password to regain access to the terminal.

5. If you want to activate the single button connect feature, select **Single Button Log On**. This feature invokes a dialog box that requires the terminal operator to press **Enter** or click the **Logon** button on the dialog box to log in. If someone other than the auto logon user wants to log onto the terminal, press **Esc** or **Alt-F4**.

6. From the **Account** list, select the account that the system will use to log on the terminal operator.

7. Select **Enable Reset Hotke**y to allow the terminal to be reset to factory defaults (registry and shortcuts) by pressing and holding **F9** key during boot.

   CAUTION: If you disable the F9 reset function and then change monitors or change display settings resulting in your monitor becoming unable to display, the only way to recover the client will be to reflash it.

8. Click **OK** at the top of the window to save your changes.

Switching to a different user

To switch to a different user when booting:

1. Press the power button to start the system.

2. Press **Esc** or **Alt-F4** before the automatic logon countdown completes.

3. Log on as the user of your choice.

4

Control Panel

This chapter provides an overview of the programs in the Control Panel and provides step-by-step instructions to perform certain tasks. You can use many of the programs for local administration, while you use others, such as DHCP Options and SNMP, for remote administration.

To open the Control Panel:

■ From the desktop, select **Start > Settings > Control Panel**.

   or

■ From the HP Connection Administrator window, click the **Control Panel** button.
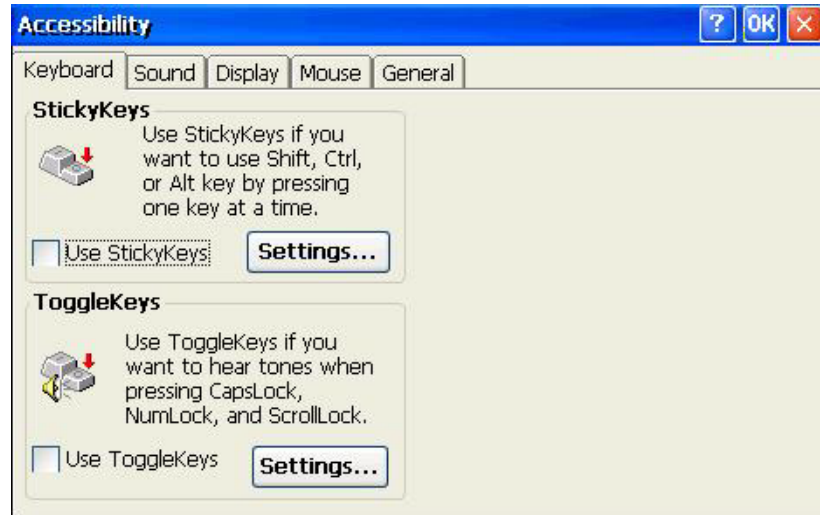

✎ The LPD Control program is available only on terminals equipped with a serial port.

Accessibility

The Accessibility dialog box allows you to configure the terminal with 508 Accessibility features. Accessibility options are available for the keyboard, sound, display, and mouse.

- **Keyboard:** Allows you to enable **StickyKeys,** which lets you use the **Shift**, **Ctrl**, and **Alt** keys pressing one key at a time rather than holding them all down simultaneously. You can also enable **ToggleKeys** to hear tones when pressing the **Caps Lock**, **Num Lock**, and **Scroll Lock** keys.

- **Sound:** Allows you to enable **SoundSentry**, which causes Windows to generate visual warnings when the system makes a sound.

- **Display:** Allows you to enable **High Contrast**, which causes Windows to use colors and fonts designed for easy reading.

- **Mouse:** Allows you to enable **MouseKeys**, which lets you control the pointer with the numeric keypad on the keyboard.

- **General:** Allows you to automatically turn off accessibility features after a set amount of idle time. You can also enable the notification feature, which causes Windows to make a sound when you turn a feature on or off.

Certificates

The Certificates dialog box allows you to import, store, and view security certificates. Certificates and certificate authorities ensure that an SSL connection is made to the intended secure server. Certificate information is exchanged between the terminal browser and the secure server when establishing a connection. If a trusted certificate authority can authenticate the certificate, the secure page automatically displays. A private key is also used to encrypt data over an SSL connection.

To import a certificate or private key:

1. Select the type of certificate you would like to import from the drop-down list.

   ❏ **Trusted Authorities** are digital certificates issued by certification authorities. The Windows CE browser comes with a pre-defined list of trusted certification authorities that include Equifax, Thwarte, Entrust, GlobalSign, GTE, and others.

   ❏ **My Certificates** are your personal digital certificates.

   ❏ **Other Authorities** are intermediate certificate authorities. No intermediate authorities are loaded by default.

2. Click **Import,** select the location source of the certificate or key, and then click **OK**.

   ❏ **From a File** allows you to import a certificate or key from any mapped drive. Browse to the certificate or key and select it, or select the **Type** and type the name of the certificate or key in the **Name** field.

❏ **From a Smart Card** allows you to import a certificate from a Smart Card. Make sure the Smart Card is inserted and select a **Reader** from the list. The radio button is active only if a smart card is inserted.

❏ **Friendly name** allows you to rename a certificate that you import.

3. Click **OK**.

Date/Time

The Date/Time Properties dialog box allows you to set the date and current time, select the appropriate time zone, and enable automatic clock adjustment for daylight savings time for the terminal.

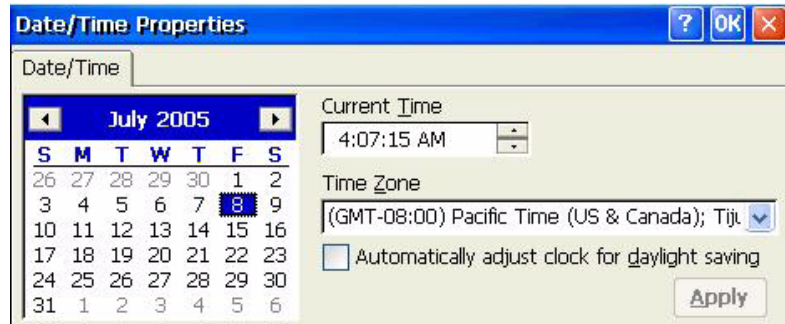

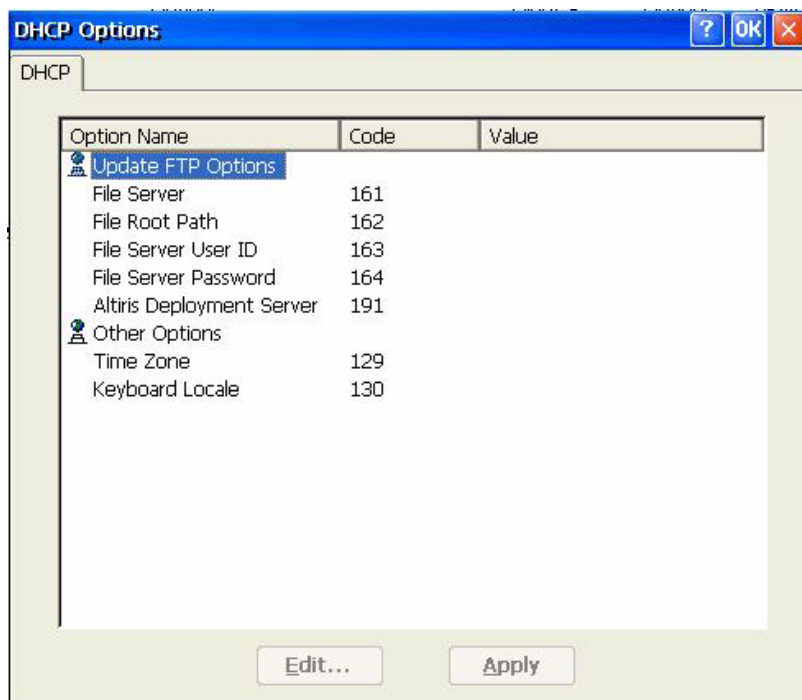

» Select the appropriate date and time information, and then click **Apply**.

DHCP Options

The DHCP Options page allows you to configure the thin client with the port locations for various information that the client retrieves from the FTP server. For information about resetting thin client settings to factory defaults, see the "System" section later in this chapter.

To change port values:

1. Double-click on the name of the option to change. A dialog box displays with a list of all valid options.

2. Select the appropriate value from the list, and then click **OK**.

Dialing

The Dialing Properties dialog box allows you to:

- Add or select a dialing location

- Configure dial-up settings for the selected location. Local settings include the area code, county/region code, and tone or pulse dialing.

- Disable call waiting.

- Set up dialing patterns for local, long distance, and international calls.
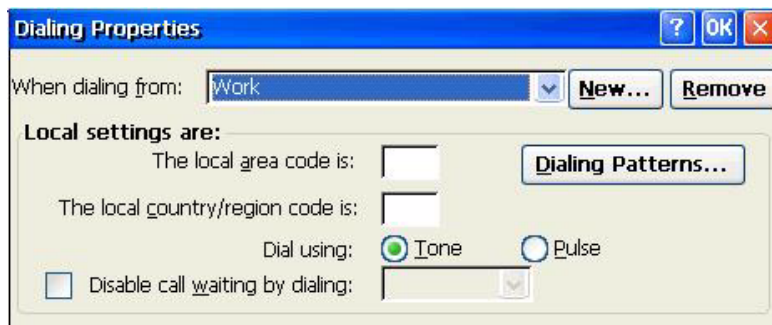

To add a dialing location:

1. Select or add a **When dialing from** location and type the local settings for the location.

2. Click **OK** after entering the information.

To configure the system to use an area code for local calls:
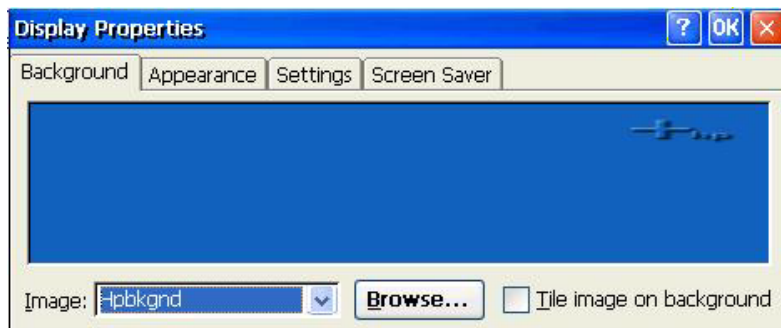

1. Click **Dialing Patterns.**

2. In the **For Local calls dial** box, add an **F** before the **G**. For example, **F**,**G** will dial the area code, then 7-digit phone number.

Display

The Display Properties dialog box allows you to configure the background image, appearance scheme, screen resolution, color quality, refresh frequency, and screen saver.

✎ You can also access the Display Properties dialog box by right-clicking on the desktop and selecting **Properties**.

Reboot the terminal for display property changes to take effect.

The Background tab allows you to set the background image that appears on your monitor. You can use a background image that is any of the following formats:

■ bmp

■ gif

■ jpeg

Save background image files in the **Hard Drive** folder to assure the client can find them after a reboot.

The Appearance tab allows you to set the Windows CE color scheme.

The Settings tab includes a **Test** button that you can use to test the resolution and refresh settings. If you select settings your monitor does not support and you do not test updated settings, the next time you reboot, your display will not work and you must press **F9** to reset to defaults. For more information about screen settings, see "Screen Settings".

In the Screen Saver tab you can set up password protection as well as configure the following screen saver options:

■ no screen saver

■ turn off monitor

■ floating image

■ tiled image

The following table lists the available screen resolutions, color quality settings, and refresh frequencies. The default is 800x600x16 @ 60Hz.

Screen Settings

Resolution/Color	60Hz	70Hz	72Hz	75Hz	85Hz
640x480x8	X	X	X	X	X
640x480x16	X	X	X	X	X
640x480x32	X	X	X	X	X
800x600x8	X	X	X	X	X
800x600x16	X	X	X	X	X
800x600x32	X	X	X	X	X
1024x768x8	X	X	X	X	X
1024x768x16	X	X	X	X	X
1024x768x32	X	X	X	X	X
*1152x864x16	X	X		X	X
*1152x864x32	X	X		X	
1280x1024x8	X	X	X	X	X
1280x1024x16	X	X	X	X	X
1280x1024x32	X				
*1600x1200x8	X	X	X	X	
*1600x1200x16	X	X	X	X	

*These resolutions are not supported on all thin client models.

*All refresh rates are not supported by all monitors.

✎ If you set the display settings out of range, you must reset the terminal to factory defaults by rebooting the terminal and holding down the **F9** key until you see a window that says "Loading..." at the bottom. Resetting the terminal to factory defaults erases all configuration settings and connections.

Global ICA Client Settings

The Global ICA Client Settings dialog box allows you to configure ICA default client settings.
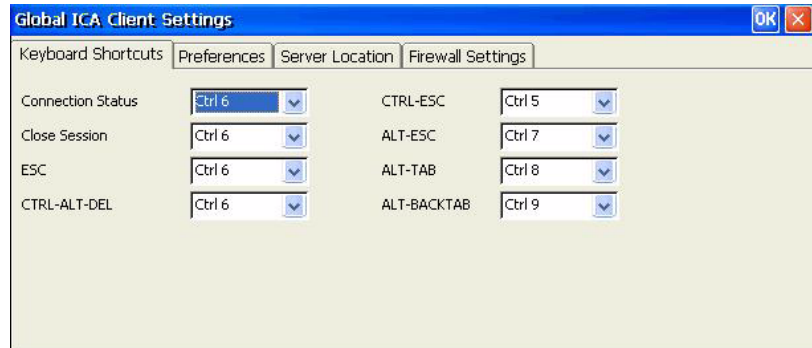

The Global ICA Client Settings dialog box contains the following:

Keyboard Shortcuts

The Keyboard Shortcuts tab allows you to configure hotkey combinations that you can use during active ICA sessions. You can assign the hotkeys used to perform a function by selecting the hotkey combinations from the list next to each function.

■ **Connection Status** invokes a message about the status of the connection.

■ **Close Session** disconnects the terminal from the server but does not actually close the session on the server. The session will continue to run on the server until the terminal operator logs off.

■ **Esc** performs the same function as the **Esc** key.

■ **CTRL-ALT-DEL** invokes the terminal Security dialog box.

■ **CTRL-ESC** displays the Remote Task list on WinFrame servers, or displays the Start menu on MetaFrame servers.

■ **ALT-ESC** cycles the focus through the minimized icons.

■ **ALT-TAB** cycles through open applications in sequential order.

■ **ALT-BACKTAB** also cycles through open applications sequentially, but in the opposite direction.

Preferences

The Preferences tab allows you to set color preferences during an ICA session.
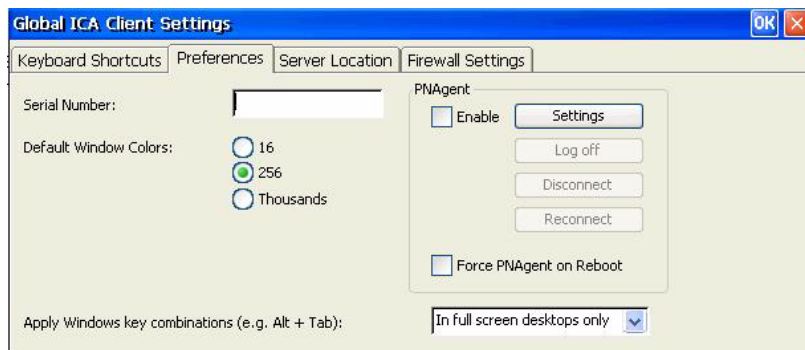

The Preferences tab contains the following:

■ **Serial Number**: Type the serial number of the ICA Client software exactly as it appears on the serial number card. This is necessary when using the ICA Windows CE Client with certain products, such as WinFrame Host/Terminal. It is not necessary for MetaFrame servers.

■ **Default Window Colors**: Select the color option for the ICA client. If the ICA server does not support the selected color option, then it defaults to 16-bit color.

■ **PNAgent:** Select to enable PNAgent.

   ❑ **Settings**: Click to display a dialog box that allows you to type the URL of the PNAgent server. You can use this server to remotely configure PNAgent settings. You can configure ICA seamless settings is these screens.

   ❑ **Force PNAgent on Reboot**: Select to cause PNAgent to prompt you to log in every time you reboot.

■ **Apply Windows key combinations**: Select the option in which you want key combinations to function.

   ❑ **In full screen desktops only** and **On the remote desktop** apply to the ICA session.

   ❑ **On the local desktop** applies to the local client.

Server Location

The Server Location tab allows you to view/add Citrix servers on the network that have ICA connections configured.

The Server Location tab contains the following:

- **Server Group**: Select whether the servers in the server address list belong to your Primary, Backup 1, or Backup 2 group.

- **Server address list**: Lists the entered server locations.

- **Add**: Click to add a server address.

- **Delete**: Click to delete a server address.

- **Rename Group**: Click to rename the selected server group.

- **Default List**: Click to recall the previous server address list.

Firewall Settings

The Firewall Settings tab allows you to set up a firewall by placing a proxy server between a server and a client.
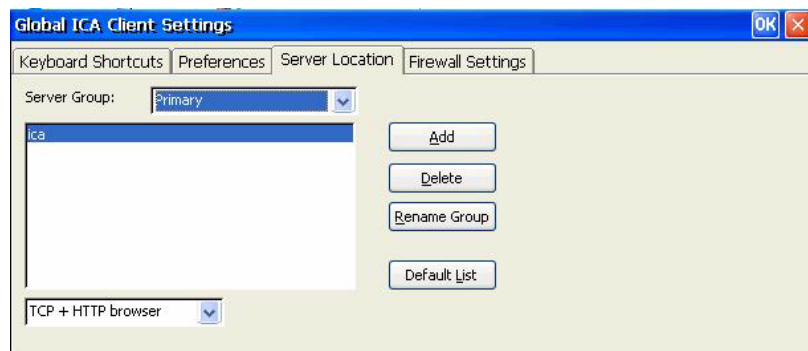

In the **Proxy** section, select a protocol from the list, and then type the proxy address and port.

In the **SSL/TLS Relay** section, type the relay address and port for the Socket Security Layer (SSL) or Transport Layer Security (TLS) protocol.

If the firewall uses address remapping, you must configure the client to use the alternate address returned by the data collector by selecting **Use alternate address through firewalls**. This is necessary whether or not you are using a SOCKS or secure proxy server.

Internet Options

The Internet Settings dialog box allows you to configure Internet browser settings on the terminal.

The Internet Settings dialog box includes the following tabs:

■ **General:** Allows you to enter start and search pages, identify the Web browser type to determine how Web pages are displayed, set the cache size, and clear cache and history.

■ **Connection:** Allows you to select LAN or autodial connections and to configure proxy server settings.

■ **Security:** Allows you to specify Web sites that are trusted, restricted, and so on. Also allows you configure ActiveX, scripting, and other advanced-type internet options.

■ **Privacy**: Allows you to configure how the browser handles cookies.

■ **Advanced:** Allows you to configure multiple internet options, including options for accessibility, browsing, multimedia, and security.

■ **Popups**: Allows you to configure how the browser handles popups, including blocking, notification when popups are blocked, and exceptions that allow popups from specific sites.

■ **Other Options**: Allows you to enable browser window resizing, enable favorites, and set the font size.

✎ Due to CE architecture, proxy exceptions are not available.

JETCET PRINT 4.0

The JETCET PRINT Professional dialog box allows you to set up the terminal for local printing from Txtpad and Internet Explorer.

✎ Windows CE is best suited for printing small documents.

✎ Printer port designations are as follows:
- LPT1 = parallel
- LPT2 = USB

To set up a printer:

1. In the Default Printer box, select a default printer.

2. In the **Manufacturer Model** box, select the printer model.

3. If printing using a serial connection, in the **Serial Handshaking** box select either **Hardware** or **Software** for serial handshaking between the terminal and printer.

4. Set the appropriate print spooler options. You must select **Use Spooler** for other options to become available.

5. Click the **Properties** button to configure printer settings. Define printer settings as appropriate.

6. If you want to configure Internet Printing (IPP) to allow you to print to network printers:

   a. Click the Internet Printing tab.

   b. Click **Add Port**.

   c. Type the IP address of the network printer to which you want to print.

   d. Select the port from which to send print jobs in the **Virtual Port** box.
   NOTE: To avoid port conflicts, HP recommends selecting COM2 as the virtual port.

   e. Click **OK**.

   f. Click **OK** to exit the JETCET dialog box.

✎ For more information, refer to the JETCET user guide at http://www.westtek.com/support/pocketpc/jetcet.html.

✎ Internet Explorer uses LPT1 as its default printer port. If you want to print using a different port, in Internet Explorer, select **File > Page Setup** and select the port to which to print.

Keyboard

The Keyboard Properties dialog box allows you to configure your keyboard.
Repeat delay determines how long you must hold down a key before its character starts repeating.

Repeat rate determines how quickly a character repeatedly displays on screen when the key is held down.

If you are a legacy user, see "Regional Settings" to change keyboard settings.

Select Disable local Windows key combinations (e.g. ALT+TAB) to disable the passing of hotkeys to the terminal service server.

LPD Control

The LPD Control dialog box allows you to set the terminal up as a line printer (print server).

✎ HP Compaq t5300 thin client models do not have legacy ports. Therefore, the LPD Control program will not appear in the Control Panel for those systems.

To set the terminal up as a print server:

1. Select **Enable Printer**.

2. Type the **Printer Name** and **Network Port**.

3. Select the appropriate printer port from the list. If you select a COM port, you have the option of configuring the serial port by clicking **Configure** and typing the appropriate parameters.

4. Select **Send Form Feed** if form feeds are necessary. Form feeds are primarily used with older printer technology.

✎ Verify the terminal serial port is enabled in BIOS and in the Control Panel Port Lock window. You must also set up the application server for LPD printing.

Modems

The Modem Settings dialog box allows you to access and modify settings for external modems.
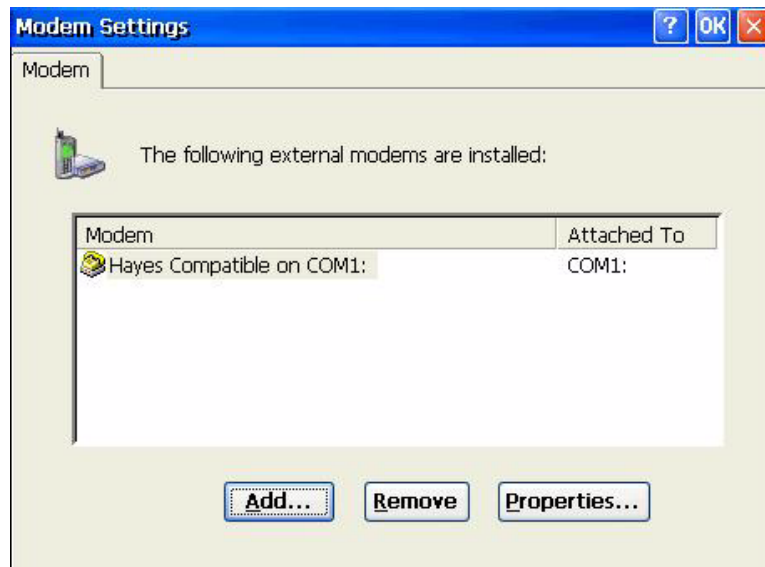

Refer to the device instructions that shipped with the modem, or located on the manufacturer Web site, for listings of modem "AT" commands available for the modem.

Mouse

The Mouse Properties dialog box allows you to set the mouse double-click sensitivity for speed and physical distance between clicks.
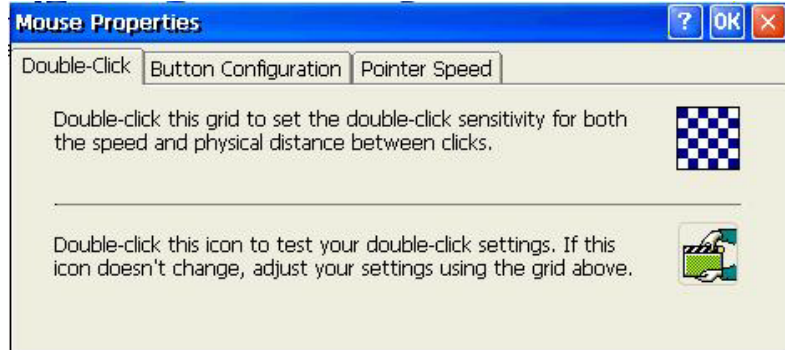

■ Use the Double-Click tab to set the double-click sensitivity by double-clicking the grid icon, then test the setting by double-clicking the test icon.

■ Use the Button Configuration tab to configure for left-handed use.

■ Use the Pointer Speed tab to configure how fast the mouse pointer moves on the screen based on how the users moves the mouse.

Network and Dial-up Connections

The Network and Dial-up Connections window allows you to configure connectivity between the terminal and the Internet, a network, or a computer.

To make a new connection, double-click the **Make New Connection** icon, select the type of connection you want to make, and then configure the connection.

Choose from the following connection types:

■ Dial-up connection

■ Direct connection

■ VPN (PPTP)

■ VPN (L2TP)

■ Ethernet (PPPoE)

Dial-up connection

You can use a dial-up modem with the thin client to access a dial-up server. This method provides two ways to access the enterprise intranet:

■ An enterprise dial-up server connects directly to the enterprise intranet.

■ An Internet Service Provider (ISP) dial-up server provides access to the Internet, from which the thin client must access an enterprise Point-to-Point Tunneling Protocol (PPTP) Virtual Private Network (VPN) server that connects to the enterprise intranet.

✎ The dial-up server must be a Microsoft Remote Access Server or another server that supports industry-standard protocols.

Direct connection

This type of connection allows you to connect directly to another computer through the serial port on the terminal.

✎ This option is available only to thin clients with serial ports.

Virtual Private Network (PPTP) connection

Point-to-Point Tunneling Protocol (PPTP) is a network protocol that enables the secure transfer of data between a remote client (in this case the thin client) and an enterprise server environment by creating a VPN across TCP/IP-based data networks such as the Internet. It provides a password-protected path through the enterprise firewall to the enterprise server environment in which the network and session services required by the thin client reside.

Access to the internet requires an Internet Service Provider (ISP). You may use any of the standard means of connecting to the ISP, such as a dial-up modem, cable modem, or DSL modem.

You must first establish the connection to the ISP, before contacting the enterprise PPTP VPN server. This includes dial-up access as well as direct access through the cable modem and DSL modem paths.

Virtual Private Network (L2TP) connection

Layer Two Tunneling Protocol (L2TP) merges Microsoft's PPTP protocol with Cisco's Layer Two Forwarding (L2F) protocol. L2TP is basically the same as PPTP; the primary difference is that L2TP supports encryption.

PPP Over Ethernet (PPPoE) connection

This is a connection from the thin client Ethernet port directly to the enterprise intranet. No additional hardware is required.

In this configuration all network services may be used, including the enterprise DHCP server. A DHCP server on the network may provide not only the terminal's IP address, but also the location of the file server containing the software updates.

Port Lock

The Port Lock dialog box allows you to enable or disable COM 1 ports, LPT ports, and USB mass storage devices.

Port Lock	? OK ✕

Port Lock

☑ Enable COM 1

☑ Enable LPT

☑ Enable USB mass storage devices (floppy, disk-on-key, cd-rom, etc)
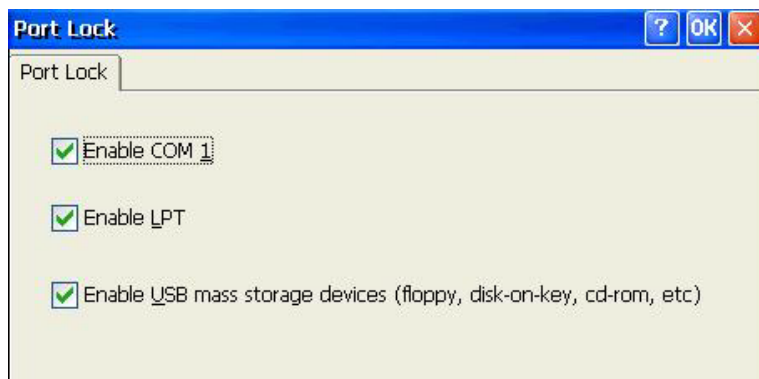

To enable a port, select the appropriate check box(es), and then click **OK**.

RDP/ICA Printers

The RDP/ICA Printers dialog box allows you to add local RDP/ICA printer configurations and modify existing RDP/ICA printer configurations. This enables the terminal to print from an RDP/ICA server session to a local printer.

✎ Windows CE is best suited for printing smaller documents.

Printers	OK ✕

RDP/ICA Printers

Add Printer   AGFA-
                AccuS...
The RDP/ICA Printers dialog box contains an **Add Printer** icon and an icon for each configured printer.

You can use Internet Printing Protocol (IPP) to print to network printers. IPP defines a standard protocol for printing as well as managing print jobs.

✎ To avoid port conflicts, HP recommends using COM2 for IPP printing.

Adding a printer

To add a printer configuration from the Printers dialog box:

1. Double-click the **Add Printer** icon to invoke the Printer Wizard, which allows you to configure a new printer.

2. In the first panel of the wizard, select the appropriate port that you want the printer to use, and then click **Next**.
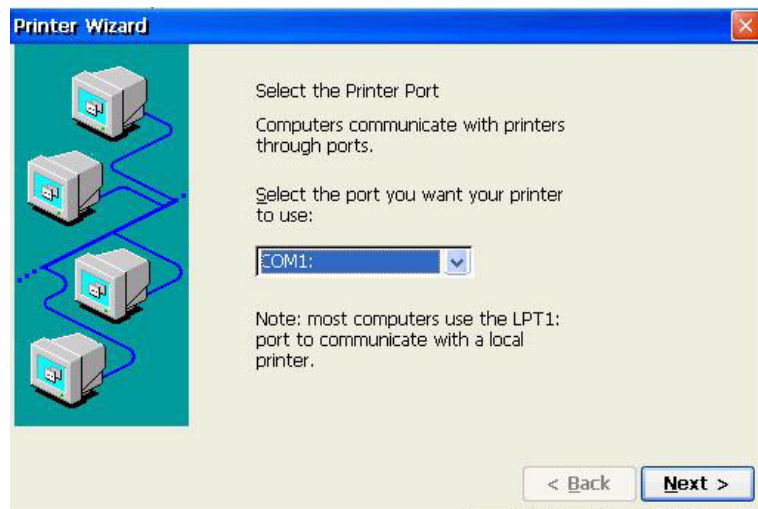

3. In the next wizard panel, select the printer manufacturer and model. If the desired printer is not listed, select **User Defined**, and then click **Next**.

⚠ **CAUTION:** It is critical that the model name entered in step 3 matches EXACTLY with the model name of the driver installed on the terminal server. Otherwise, printing will fail.

4. The following panel appears only if you selected **Network** in step 2. In this panel, type the network path for the printer. If you selected **User Defined** in the previous wizard panel, type the manufacturer and model of the printer.

5. In the next wizard panel, type a name for the printer, and then click **Next**.
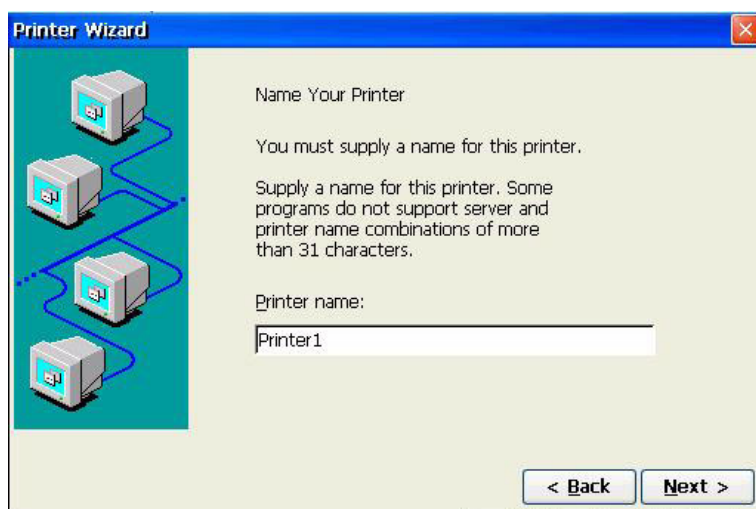

6. In the next wizard panel, select whether you want to configure another printer, and then click **Next**.

7. After completing all printer configuration selections, click **Finish**.

8. Connect to an RDP session, add the printer, and verify that it is working properly.

Modifying an existing printer configuration

To modify an existing printer configuration in the Printers dialog box:

1. Double-click the desired printer icon or select the icon and click **Properties**. The Printer Properties dialog box displays.

2. Make any necessary modifications, and then click **OK** to save.

Regional Settings

The Regional and Language Settings dialog box allows you to customize regional settings for the terminal. You can change the way Windows CE displays numbers, currency amounts, times, and dates.
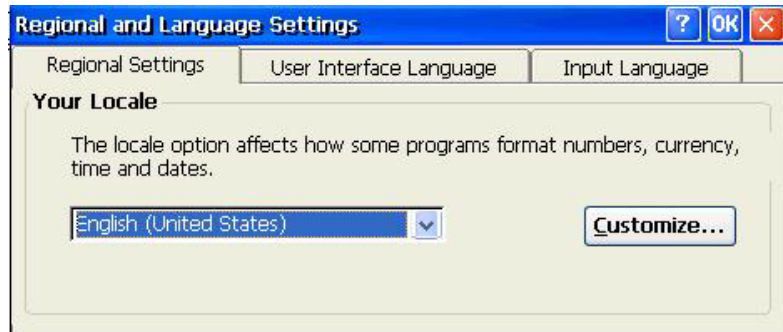

The Regional Settings Properties dialog box includes the following tabs:

■ **Regional Settings:** Allows you to select an input locale, which determines how some programs format numbers, currency, time, and dates. The options available on the other tabs are determined by the selected region.

Click **Customize** to configure the way Windows displays the following:

❏ Numbers

❏ Currency

❏ Time

❏ Date

■ **User Interface Language:** Allows you to determine the language used for the menus, dialogs and alerts. Only English is supported.

■ **Input Language:** Allows you to select the keyboard language. You can select multiple languages. You can toggle between languages by clicking on the language system tray icon.

Security

The Security dialog box allows you to control various terminal functions related to security and terminal operator accounts.

Enabling security

System security is enabled by default, which forces users to log in if the automatic login feature is not enabled.

■ Select **Lock screen when pressing Ctrl+Alt+Delete** to allow users to lock the terminal through the **Ctrl**+**Alt**+**Delete** keyboard command.

■ Select **Automatic Log On** to bypass the need for the user to enter a password to log in. This also activates the **Single Button Log On** check box and **Account** list.

❏ Select **Single Button Log On** to enable the single button connect feature, which invokes a dialog box that requires the terminal operator to press a keyboard key or click the **Logon** button on the dialog box to log in.

❏ In the **Account** list, select the account that the terminal will use to log in user. For information about creating a new account, see "Creating a user account,"

Select **Enable Reset Hotkey** if you want to allow users to reset the terminal to factory defaults (registry and shortcuts) by pressing and holding the **F9** key during boot.

Creating a user account

To create a new security account for a terminal operator, select the Users tab on the Security dialog box. This tab lists all the operator accounts and shows which accounts are set up with Administrator security privileges and which accounts are enabled.

For more information about creating user accounts, see Chapter 3, in section "Creating user accounts."

SNMP

You can manage the terminal through standard third-party simple network management protocol (SNMP) tools. The SNMP Network Administration dialog box allows you to enter parameters required for SNMP management.
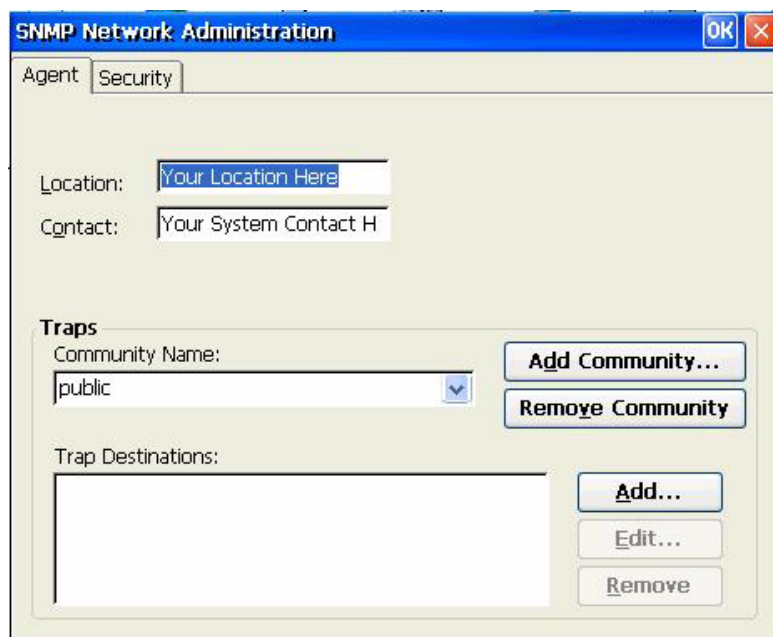

SNMP agents run in network elements and respond to Network Management Station (NMS) queries (GETs). SNMP provides a means to query all terminals assigned to a specific community. Each community should have a unique name, and all members of a community have the same access privileges. You can assign a single terminal to multiple communities.

Agents send unsolicited reports (traps) back to a specified IP address when a particular network activity occurs. The following traps are supported: cold start, warm start, authentication failure, link down, and link up.

To add a new community:

1. Click the Agent tab.

2. In the **Traps** section, click **Add Community**.

3. Type the new community name, and then click **OK**.

To add and assign rights to an accepted community:

1. Click the Security tab.
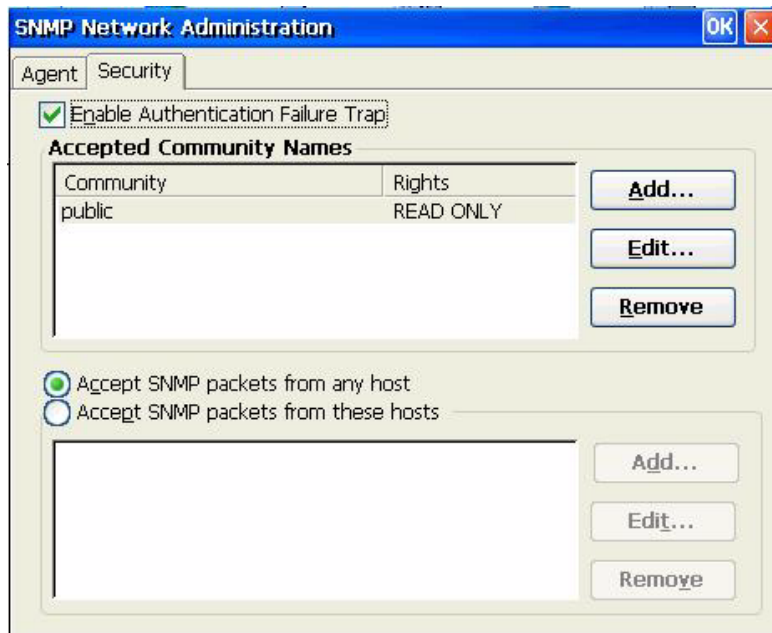

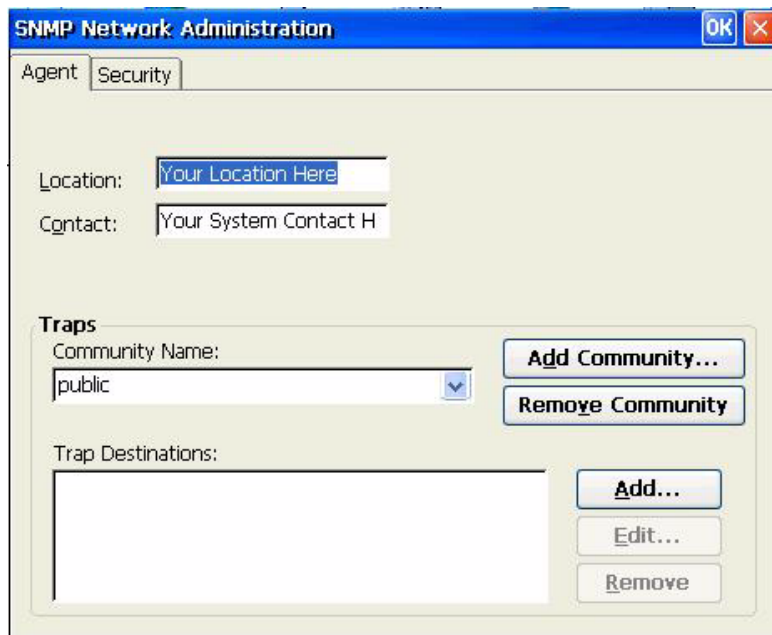

2. Click **Add** in the **Accepted Community Names** section. The Community Configuration dialog is displayed.

3. Type the name of the community in the **Community Name** box.

4. Select the rights to the community in the **Rights** list, and then click **OK**.

To add SNMP packets:

1. Click the Security tab.

2. Select **Accept SNMP Packets from these hosts**.

3. Click **Add** in the SNMP packets section. The SNMP Configuration dialog displays.

4. Type the host name or IP address, and then click **OK**.

5. Repeat steps **1** and **2** to add more hosts.

To configure SNMP:

1. On the Agent tab, type the physical location of the terminal in the **Location** box.

2. Type the name of the contact person responsible for the terminal in the **Contact** box.

3. Assign the terminal to a community by selecting a community from the **Community Name** list.

4. To add a trap destination:

   a. In the **Trap Destinations** section, click **Add**. The SNMP Configuration dialog is displayed.

   b. Type the host name or IP address of the NMS trap server, and then click **OK**.

5. If you want to add or change SNMP security settings, click the Security tab.
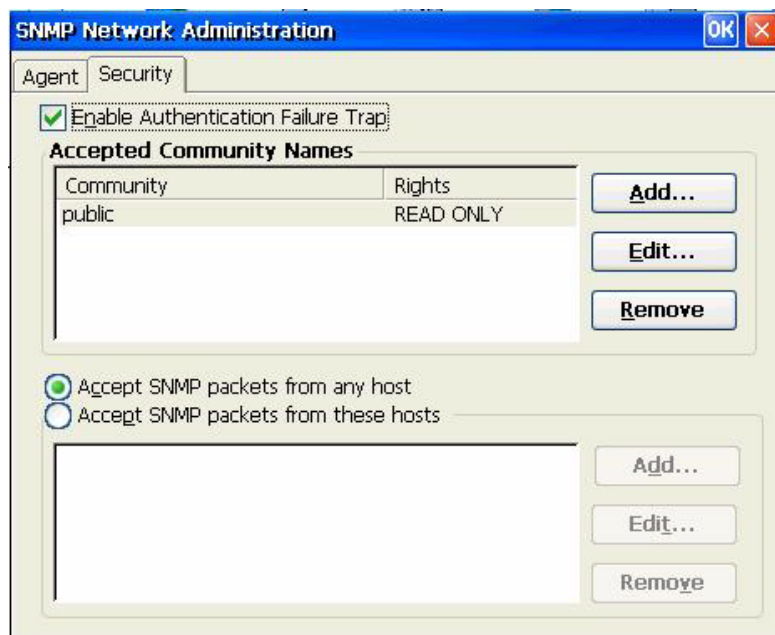

6. To enable an authentication failure trap, select **Enable Authentication Failure Trap**.

7. Select the hosts from which SNMP packets may be accepted. Choose either **Accept SNMP packets from any host** or **Accept SNMP packets from these hosts**.

8. Click **OK** after entering all the necessary SNMP information.

SNTP Client

The SNTP dialog box allows administrators to synchronize the clocks on all thin clients. Administrators can set thin clients to automatically synchronize with an Internet time server or with a boot server.

Synchronization can occur only when your computer is connected to the Internet.

✎ This feature can generate significant network traffic.

System

The System Properties dialog box allows you to view manufacturer and product information, network settings, and copyright information. You can also reset the terminal to default factory settings, adjust the memory allocated for storage and running programs, assign a device name for network identification purposes, and configure the network card.
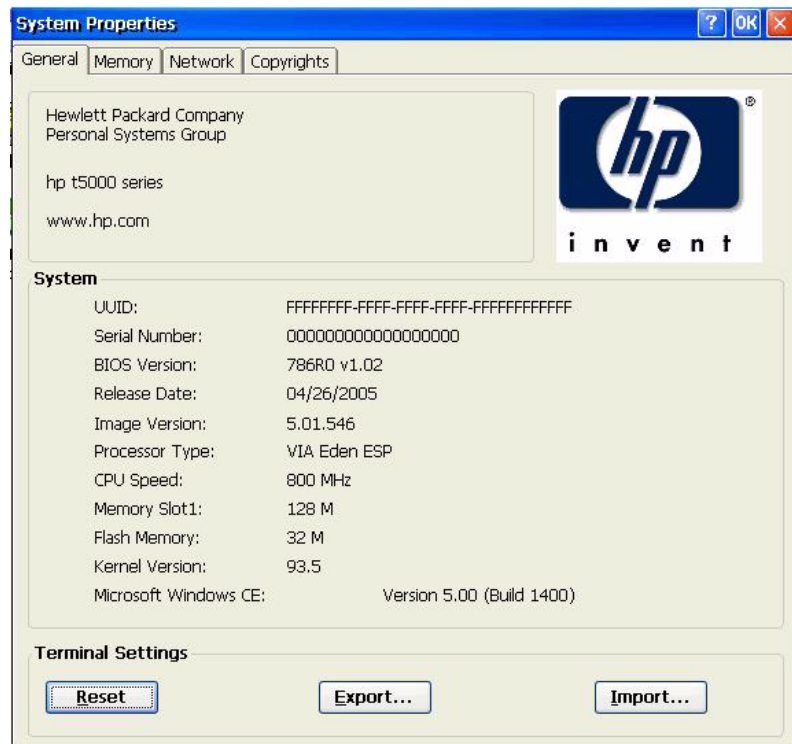

The System Properties dialog box includes the following tabs:

■ **General:** Displays manufacturer and product information for the terminal. Includes a **Reset** button that you can use to reset the terminal to factory default property settings. It also includes **Export** and **Import** buttons for easy registry import/export For more information, see "Copying registry settings".

■ **Memory:** Allows you to adjust memory allocation between memory for storage room and memory needed to run programs.

■ **Network:** Allows you to designate a device name and description that identifies the terminal across the network. You can type a name or accept the name provided by the DHCP server. The default device name is "HP" followed by the MAC address. If the device is reset to factory defaults, the device name reverts to the factory default name.

This tab also displays network settings and provides a **Configure Network Card** button that allows you to adjust the speed/duplex for the card.

The **Renew** button renews the terminal IP address.

■ **Copyrights:** Displays copyright information for the terminal.

Resetting settings to factory defaults

To reset all thin client settings to factory defaults:

1. Click the General tab.

2. In the **Terminal Settings** section, click **Reset**.

3. Click **Yes** to reset the terminal to factory settings. The terminal restarts.

   ❏ The default for **File Server** is 161.

   ❏ The default for **Path and Filename** is 162.

Copying registry settings

You can copy and transfer the registry settings from one thin client to another. Also known as "ARP", this feature allows you to configure a thin client and then transfer that configuration to multiple other thin clients. To clone an entire thin client image, you must first update the image, and then transfer the registry files.

You can transfer registry settings on only "like-to-like" clients, meaning that the thin client you transfer to must have the same of the following list as the thin client you transfer from.

■ model number

■ build number

■ add-ons

To transfer registry settings to one thin client:

1. Configure a thin client to your specifications.

2. In **Control Panel** > **System** > General tab, in the **Terminal Settings** section, click **Export**.

3. Navigate to where you want to save the settings file. You can save the file to the hard drive, a network drive, a disk-on key, etc. After you give the file and name and click **OK** to save the file, it can take up to five minutes for the file to save.

4. After exporting the registry settings file, from the thin client to update, go to **Control Panel** > **System** > General tab, and in the **Terminal Settings** section, click **Import.**

5. Navigate to where you exported the settings file, select the file, and then click **OK**. You must restart the client for the new settings to take effect.

✎ The registry settings file does not include desktop shortcuts.

✎ You can use Altiris or FTP to transfer registry settings to multiple thin clients.

For more information about exporting registry settings, see Chapter 6, "Registry Import/Export."

System Update

The System Update dialog box allows you to define the means by which you update the terminal image. The feature updates only the operating system, The BIOS is not updated. You can update the image:

■ Directly from HP by manually entering HP FTP file server information for the server that contains the update.

■ By allowing the DHCP server to locate the FTP file server that contains the update.

You may want to update your image because of the following:

» You receive a new client, perform updates to the client image, and decide you want to revert to the "good, known" image.

» An image gets corrupted and the client requires re-imaging.

» Your client image is old and you want the newest available stable image.

The System Update dialog box contains two tabs:

■ Direct from HP

■ FTP

△ **CAUTION:** Turning off the power before the update is complete may corrupt the flash memory on the terminal.

For information about automatically updating your client, see the related white paper at:
http://h20000.www2.hp.com/bc/docs/support/SupportManual/c00448549/c00448549.pdf.

Direct from HP

Use this tab to update the terminal with the latest available image directly from Hewlett-Packard or restore the image currently installed on the terminal.

To update or restore the image, select the appropriate button, and then click **Continue**.

FTP

This tab allows you to automatically update the image by having the DHCP server provide the location of the file server on which the upgrade files are located. This feature provides an alternative to Altiris for image deployment.

✎ For more information on setting DHCP values, refer to the "DHCP Options" section in this chapter.

To update the image using the DHCP server:
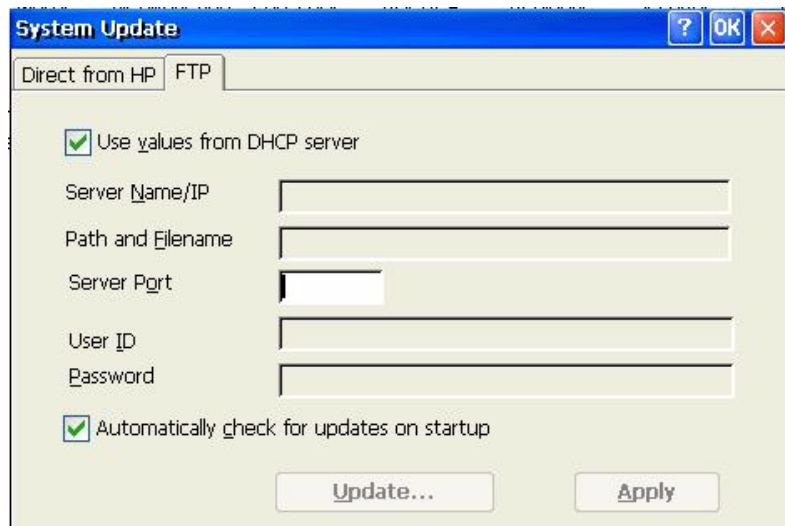

1. Select **Use Values from DHCP Server.**
2. In the Server Name/IP box, type the FTP Server Name/IP.

3. In the **Path and Filename** box, type the Path and File name of the image.

4. In the **Server Port** box, type the FTP server port.

5. In the **User ID and Password** boxes, type the user ID and password required by the FTP file server.

6. To automatically update the image each time the terminal is restarted, select **Automatically check for updates on startup**. This features allows you to place a single, updated image on an FTP site and have clients automatically check that site at bootup and update with the new image.

7. Click **Update** to begin the update process.

The DHCP Options dialog allows you to set the DHCP tags that identify the FTP location of the update image.

To change the FTP option IDs, type over the entry in the **Server Port** box, and then click **OK**. The value must match what is set up on the DHCP server.

Terminal Server Client Licenses

Terminal Server Clie...

The Terminal Server Client Licenses dialog box allows you to view stored licenses. You can use this window to delete or save licenses.
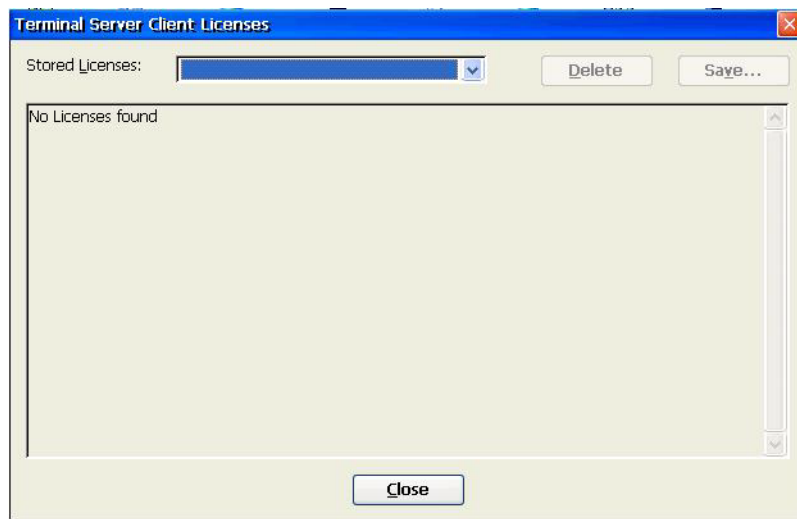

View or Remove Programs

The View or Remove Programs dialog box allows you to view or remove software programs currently installed on the terminal.
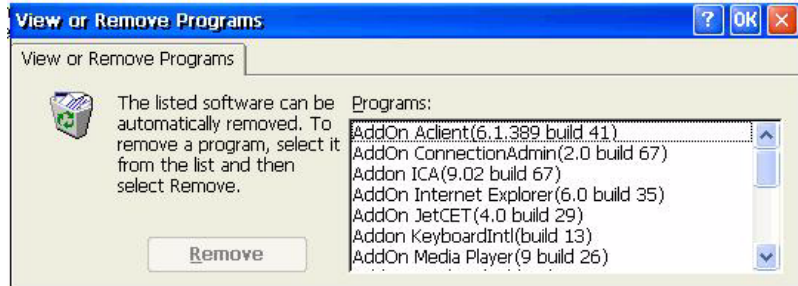

To remove a program, select the program from the list and click **Remove**.

VNC Server

Virtual Network Computing (VNC) is a remote control program that allows you to view and interact with one computer (the "server") using a simple program (the "viewer") on another computer anywhere on the Internet. The VNC Server runs as a service and therefore is available even when the user is logged off the thin client.
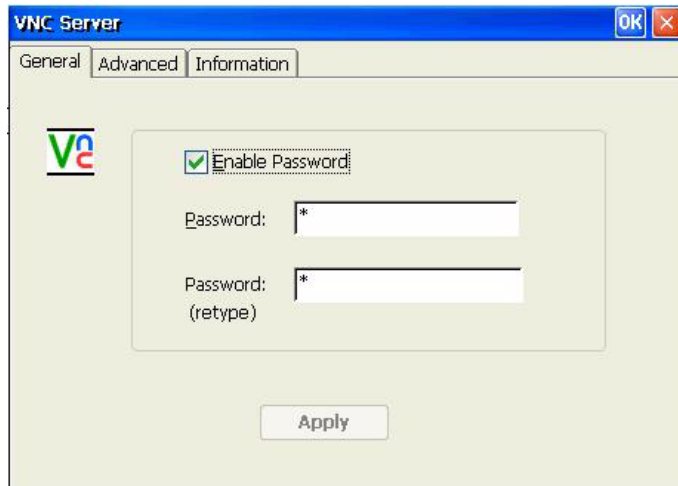

Settings for VNC Server

Configure VNC Server on your thin client by selecting the following:

Check Box	Explanation
Prompt local user to accept incoming connections	The default should be ENABLED and **Auto Accept** should be ENABLED
Enable Viewer Cursor	This setting allows the viewer to show its cursor on the screen while moving the mouse. The viewer shows a small dot that points to the actual location of the "hot spot" of the remote cursor location. Enabling this setting will show the local cursor of the viewer; however, the remote dot will lag behind the local viewer cursor as it tries to synchronize the local viewer cursor.
Accept input events from clients	Enabling this setting will allow the viewer to control the keyboard and mouse of the unit remotely.
Autoport Select	This setting will be devalued, leaving only the "Accept connections on port" and "Allow HTTP connections on port".
Accept connections on port	Defaults to the standard VNC port of 5900.
Allow HTTP connections on port	Defaults to the standard VNC port of 5800 for JVM (Java)-enabled Web Browser Viewers.

✎ Windows CE does not support Java.

You can find additional information about VNC Server features at: http://www.realvnc.com/documentation.html

Volumes & Sounds

The Volumes & Sounds Properties dialog box allows you to adjust the volume setting and enable sounds for various events and conditions. You can also create custom sound schemes for various events.
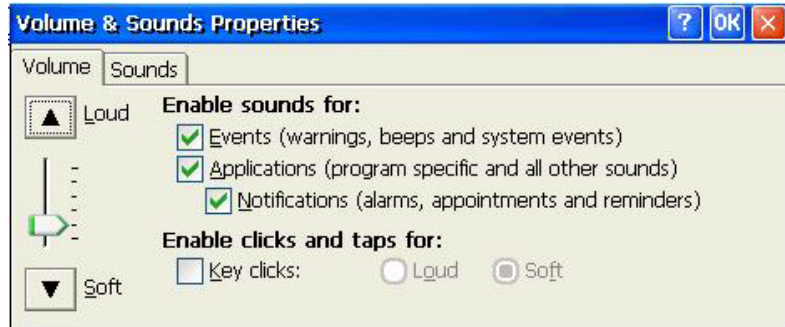

To open the Volumes and Sounds Properties dialog box, double-click the **Volumes & Sounds** icon in the Control Panel.

5

Programs and Add-ons

This chapter provides detailed information about programs and add-on programs for the CE 5.0 image. You can download add-ons from the HP Support Web site.

Add-ons are programs that you can add and remove from a thin client. Add-ons consist of both programs that come with the default thin client image, and programs that you can add.

The following table provides a list of Add-ons and whether they are included in the image:

Add-On	In Factory Image
Aclient	Y
BioTouch	
ClearVue Office Viewers	
ConAdm 2.0	Y
Edgeport	
Elotouch for 5.00	
ICA 8.x	
ICA 9.0	Y
Internet Explorer 6.0	Y
JetCet 3.1	
JetCet 4.0	Y
Keyboard Intl	Y
Media Player 9.0	Y
Messenger 4.0	

Add-On	In Factory Image
Messenger 5.0	
PCSAM	Y
RDP 5.1	
RDP 5.5	Y
Setup Wizard for 5.0	Y
SNTP Client 5.0	Y
TEC 5.0	Y
TxtPad	Y
USB Mass Storage 5.0	Y
USB Modem	Y
USB Parallel Port	Y
VNC Server	Y
Win Explorer	Y
SCM SC Reader for 5.0	Y
USB Wireless	
XLan 220	

Programs

HP Connections for Citrix Software

The HP Connections for Citrix Software window provides a quick and easy means of creating new ICA connections. You can also delete and edit connections, as well as create desktop shortcuts for connections.

✎ Any ICA connection created will appear in both the HP Connection Administrator window and the HP Connections for Citrix Software window. For more information about HP Connection Administrator, see Chapter 3, "HP Connection Administrator."

You can access the HP Connections for Citrix Software window from:

■ **Start > Programs > HP Connections for Citrix Software**.

■ The shortcut icon on the desktop.

Creating a New ICA connection

The upper section of the window contains the ICA connection.

To create a new connection:

■ Double-click the icon in the top section.

  or

■ From the **File** menu, highlight **New Connection** and select the type of connection you want to make. Follow the instructions in the Wizard or dialog.

Deleting a connection

To delete an established connection:

1. Right-click on the connection and select **Delete Connection**.

   or

   Select the connection and press the **Delete** key.

2. Click **Yes** to delete the connection.

✎ Deleting a connection through HP Connections for Citrix Software also deletes the connection from HP Connection Adminstrator.

Editing a connection

To edit an established connection:

1. Right-click on the connection and select **Edit Connection**.

2. Modify the connection.

Creating a desktop shortcut to a connection

You can create a shortcut to a connection on the desktop through HP Connections for Citrix Software. You cannot create shortcuts through HP Connection Administrator.

To create a shortcut, right-click on the connection and select **Send to Desktop**.

RDP 5.5

Remote Desktop Protocol (RDP) 5.5 replaces RDP 5.1 and provides the following functionality:

■ Unicode compatibility, which enables you to send Unicode values of characters as virtual key codes to the keyboard input.

■ RDP supports operation in any environment that allows network localization, automatic disconnect, and remote configuration.

■ Variable bandwidth allocation through client-side bitmap caching and optional compression for low-bandwidth connections, significantly improving performance over low-bandwidth connections.

■ Multichannel-capable protocol that permits separate virtual channels for carrying presentation data, serial-device communication, licensing information, and heavily encrypted data.

■ Remote control which lets the support staff view and control a Terminal Services session. Sharing input and display graphics between two Terminal Services sessions lets support staff diagnose and resolve problems remotely.

■ Network Load Balancing (NLB), available in Windows 2000 Advanced Server and Datacenter Server.

■ High color 8-bit, 16-bit, and 24-bit graphics are supported if they are also supported in the graphics driver.

■ Clipboard sharing, also known as clipboard redirection. The local clipboard becomes a part of the clipboard viewer chain in the remote session, allowing the user to copy and paste between applications running in both the remote session and on the local client.

■ Local-printer redirection so server applications can print locally to the client device.

■ Local audio playback so server applications can direct audio to the client device or play at the Terminal Server.

■ Local-port redirection so server applications can use parallel and COM ports of the client device.

■ Local drive redirection so server applications can use the file system (including ATA) of the client device.

■ File redirection filter that permits exposing only specific directories. If you specify that only external storage, such as Compact Flash or USB storage, be exposed through the redirected drive, information is saved only to the redirected drive.

■ TS CAL maintenance tool. This control panel window is available in any OS design that supports Control Panel programs, such as the Enterprise Web Pad. It requires that RDP client be in the run-time image.

RDP now runs in Graphics, Windowing, and Events Subsystem (GWES) rather than in its own process space. This provides faster display updates by reducing the protected server library (PSL) and kernel overhead. RDP running in GWES can improve performance up to 30%.

✎ If you configured RDP to run in GWES, you cannot run RDP inside a Web browser. Optionally, you can configure RDP to run in Microsoft ActiveX Control.

Terminal Emulation Connection

Terminal Emulation Connection (TEC) allows you to create a terminal emulation session for a terminal. You can create two different types of TECs, a one-time connection, or a connection associated with a user account.

To create a one-time connection:

1. Click **Start > Programs > Terminal Emulation**.
2. In the **Type** box select the connection type.

3. Click **Configure** to configure settings for the connection type you selected.

4. If you selected **TCP/IP** in the **Connect** box, click **Telnet Options** to further configure the connection.

5. In the **Connect To** box select the port to which to connect.

6. Click **Connect** to establish the connection. The **Connect** button is not available until the connection is properly configured.

To associate a TEC with a user account:

1. **Start > Programs > Connection Administrator**.

2. Click **Add**.

3. Select **Terminal Emulation**, and then click **OK**.

TE Client Connection Wizard - Connection Information

Connection Na<u>m</u>e:	
<u>E</u>mulation:	VT500 7-Bit
<u>V</u>T Terminal ID:	vt320
	<u>I</u>nternational Settings
☐ C<u>u</u>rsor Moves Right to Left	
<u>O</u>perating Language:	English

| <<u>B</u>ack | <u>N</u>ext> | | <u>C</u>ancel |

4. Follow the wizard to configure the connection.

TxtPad

TxtPad is a simple text editor in the Windows CE the image. TxtPad associates with the following file extensions: .txt, .ini, .log, and .arp.

✎ The maximum character limit is 5-MB of ASCII data.

TxtPad is available from a shortcut in the **Start** > **Programs** menu.

Add-ons

The following section provides information about add-ons that can be added to your CE-based thin client image.

ELO Touch Screen

The ELO Touch Screen applet allows you to enable or disable the touch screen. You can also calibrate the touch screen by clicking the **Align** button.

Messenger 5.0

The Windows Messenger 5.0 add-on adds the following functionality:

■ Support for categorizing contacts into groups and for dragging and dropping contacts.

■ User Interface (UI) improvements, including system tray notifications (known as alerts) for incoming messages, and ToolTip support.

■ An updated .NET Messenger Service.

■ Microsoft Windows Messenger for Windows CE real-time communications software combines real-time voice and text communications with file transfer capability. The .NET Messenger Service is one of two Windows Messenger client application server types. It enables a user to communicate with contacts using a .NET Passport account.

USB Wireless

The wireless add-on allows you to set up wireless connections.

To set up a wireless connection:

1. Load the driver on the unit.

2. Plug in the driver. The following screen displays.

3. Select your wireless device from the list. The device configuration screen displays.
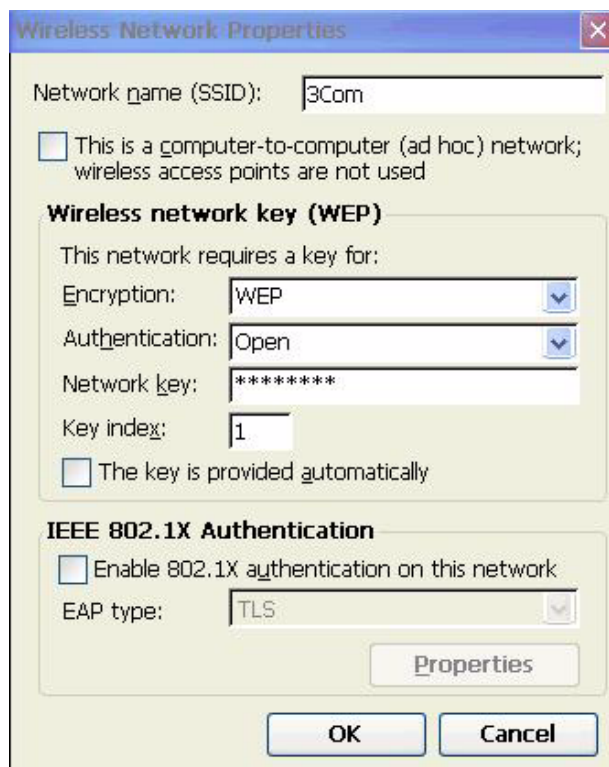

4. Configure the wireless network key and IEEE information, as required.

5. Click **OK**. The icon in the taskbar indicates an active wireless connection.

6

Registry Import/Export

This chapter explains how to import/export a thin client registry using Altiris Deployment Server. For more information about Altiris, see http://www.altiris.com/.

For information about installing an Altiris BootWorks partition, see http://h20000.www2.hp.com/bc/docs/support/SupportManual/c00215445/c00215445.pdf.

The Registry Import/Export tool is an HP-engineered software technology that makes it significantly easier and more cost efficient to manage HP thin clients. Registry Import/Export allows thin client devices to inherit properties of other thin client devices. Extracting the settings of one device and redeploying the same settings to other devices reduces network congestion. Registry settings can be 100 to 10,000 times smaller than the entire image.

Please note the following about the Registry Import/Export tool:

■ The tools requires extensive knowledge of Altiris Deployment Server.

■ The source and target machine must have the same image with the same quantity of software add-ons, and the software add-ons must be of the same revision. The Registry Import/Export Tool cannot upgrade or downgrade application versions.

■ The import/export process may take approximately two minutes to complete.

⚠ **CAUTION:** Currently, Registry Import/Export between the HP Compaq t5510 thin client and the HP Compaq t53x0 and t5500 thin clients is **not** supported.

Clearing the destination registry

Before importing a new registry to a thin client, you must clear the destination machine registry. To clear the registry, drag and drop **CE_RegReset** from the **Job** window to the **Destination Computer**. Completion of this process takes two to three minutes.

Exporting and importing a registry

To export a registry:

1. Open the Deployment Server Console.

2. Select **CE_RegExport** from the Job window and drag and drop the Job to the source unit under the Computers window. This copies the source computer's registry and prepares it for import.

3. Select **CE_RegImport** from the Job window and drag and drop the job to the destination computer under the Computers window. This imports the settings from the source computer to the destination computer.

Completion of this process takes two to three minutes.

Importing a registry to multiple units

You can import a single registry to multiple units. To import a registry to multiple units:

1. Select **CE_RegExport** from the Job window and drag and drop the Job to the source unit under the Computers window. This copies the source computer's registry and prepares it for import.

2. Select **CE_RegImport** from the Job window and drag and drop the job to "All Computers" under the Computers window. This imports the settings from the source computer to the network.

Exporting registries from multiple units

While it is possible to export registries from multiple thin clients, it is important to ensure the registry files have different names. The export process saves a time stamp as part of the name for the saved file (for example, 051306840.reg, which is May 30, 2006 at 8:40). If you export multiple units at the same time, the registry file names will be identical. To create distinct file names for each registry, HP recommends that you capture each registry a minute apart.
